Ivermectin & COVID-19

Where we are with Covid-19 Treatment

The worldwide response to the COVID-19 outbreak has been largely limited to monitoring/containment. This is why there has been a focus on prevention measures, including the huge interest in vaccines. Some companies are now beginning to focus on finding treatment (therapies). One of these companies is Merck Pharmaceuticals. Merck announced on 25 January 2021 that it is limiting further research on vaccines and is shifting its focus to therapies. Interestingly, this is the company that originally formulated ivermectin.

Is Ivermectin Legally Available in South Africa?

Yes. However, Ivermectin can only be used under the guidance of a treating doctor who is familiar with [FLCCC-I-MASK \(Front Line Covid-19 Critical Care. Alliance\) Protocols](#)

What is Ivermectin?

Ivermectin is a drug (tablet or liquid) that has been shown to inhibit the multiplication of the COVID-19 causative virus (SARS-CoV-2) *in laboratory studies*. It appears to stop the SARS-COV-2 virus from multiplying in one's body. Because of initial evidence, which has been very positive, the drug is currently the focus of many clinical trials globally. Ivermectin has potential benefits in humans with Covid-19 infection.

Facts on Ivermectin

- Ivermectin is a 40-year old trusted medication that won a Nobel prize award and is listed as an essential medication by WHO.
- It is approved by the FDA for use in humans and animals for the prevention & treatment of various parasites at oral doses of 0.2mg/kg - 0.3mg/kg respectively.
- View Side Effects, drug interactions & dosing recommendations: <http://www.drugs.com/pro/ivermectin>
- Recent studies by FLCCC Alliance www.flccc.net show clinical benefit for use in Covid-19 treatment & prophylaxis of animals and humans both topically & orally.
- A single treatment can effect a 5000-fold reduction in the amount of the COVID-19 virus within 48 hrs in cell culture.
- Ivermectin is an FDA-approved drug for parasitic infections in humans and therefore has a potential for treating other infections, including Covid-19.
- Several clinical trials are now underway to test the efficacy of ivermectin on Covid-19 infections

Recommendation

- Ivermectin is used at your own risk and reward.
- It can be used for prevention when you suspect or know that you have been exposed to Covid-19 infection.
- When you have been diagnosed with COVID-19 and you need immediate intervention, consider taking Ivermectin under the guidance of your medical practitioner.
- It has a chance of reducing the viral load, which none of the current therapies can. This way you are giving your body a fighting chance.

Availability

The drug is now available at some retail pharmacies and can also be accessed through a prescribing doctor who can order the drug through compounding pharmacies.
